WalkOn Reaction Lateral.

The *WalkOn Reaction Lateral* facilitates dorsiflexion and the use of ground reaction forces to influence the knee and ankle joint.

Indication

- Minor impairment of the plantar flexor muscles
- Minor impairment of knee extension
- Drop foot, with or without mild to moderate spasticity, e.g. caused by:
 - Stroke
 - Traumatic brain injury
 - Multiple sclerosis
 - Neuromuscular atrophy
 - Peroneal paralysis
 - Infantile cerebral palsy (ICP)

The indication must be determined by the doctor.

Benefits/advantages

- The *WalkOn Reaction Lateral* features highly dynamic properties and a high energy return
- Stabilizes the knee and ankle joints using ground reaction forces
- Noticeably longer anterior shell makes it possible to exert greater influence on deviations of the frontal axis in the knee and ankle joints
- The alignment of the orthosis affects the statics in the frontal and sagittal plane when standing
- Slim, lightweight design
- Optimized compliance thanks to removable and washable pad/strap combination
- Optimized durability: adult size tested for two million steps and junior sizes tested for one million steps
- Material: carbon fiber prepreg
- Available in a variety of adult and junior sizes
